The reader probably is acquainted with some books of the series: Physics for everybody, Chemistry for everybody, Mechanics for everybody, Algebra for everybody, Geometry for everybody and Arithmetic for everybody. In the form of short stories, these books write of the interesting processes and phenomena that take place in nature, and describe unique mechanisms; they answer riddles in mathematics, physics, chemistry and mechanics, put posers, and explain the fundamentals of some sciences in a simple and entertaining manner. Academician A. E. Fersman in his Mineralogy for everybody, which has had a run of several editions, has shown that this seemingly dry subject, with its enumerations of minerals, their forms, properties and occurrence, is quite fascinating. He has made rocks come alive and has told of their varied uses in everyday life and in technology. The author transports his readers to mountains, quarries and mines, to a fairyland of minerals and crystals. Geology, therefore, the science of the earth, which reveals to us how it took shape, its composition and the changes it has undergone in its millions of years has every right to be interesting. It penetrates deeply into time, explains the changes the earth's surface has undergone as a result of the processes that we see every day. The sun's heat, the wind, raindrops, dew, frost, the snow crystals, even the plants and animals all are geological agents whose action we are taught to understand. The Earth's surface, i.e., the landscapes that we often admire, were created by these agents and by others hidden beneath the surface which make themselves felt in such awesome events as the eruption of volcanoes and earthquakes.
